See X05248 for corresponding normal gene sequence
See X05248 for corresponding normal gene sequence
In the defective LDL-receptor gene the deletion courred between two
alu-repetitive sequences, that are in the same direction, the
deletion eliminates exons 13 and 14 and changes the reading frame
of the resulting spliced mRNa.

See X05250 for corresponding normal gene sequence
In the defective LDL-receptor gene the deletion courred between two
alu-repetitive sequences, that are in the same direction, the
deletion eliminates exons 13 and 14 and changes the reading frame
of the resulting spliced mRNA.

Unequal crossing-over between two alu-repetitive DNA sequences in
the low-density-lipoprotein-receptor gene. A possible mechanism for
the low-density-lipoprotein-receptor gene. A possible mechanism for
the defect in a patient with familial hypercholesterolaemia
L. Bur. J. Blochem. 164 (1), 77-81 (1987)

See X65248 for corresponding normal gene sequence
In the defective LDL-receptor gene the deletion ocurred between two
alu-repetitive sequences, that are in the same direction, the
deletion eliminates exons 13 and 14 and changes the reading frame
of the resulting spliced mRNA.

WHISD OF JANDER COURS for use in e.g. forensics, paternity determining polymorphic forms for use in e.g. forensics, paternity resting or phenotypic typing for disease

Claim 1; Page 219; 310pp; English.

CX 10269-X12937 are human DNA fragments which contain biallelic polymorphic markers which have been isolated using the primers represented in CX 1021-X10268. The base occupying the polymorphic site is indicated by the appropriate IUPAC-IUB ambiguity code. These fragments can be used in CX 09121-X10268. The base occupying the polymorphic site is indicated by the appropriate IUPAC-IUB ambiguity code. These fragments can be used in methods for determining polymorphic forms in an individual for use in e.g. forensics, paternity testing or for phenotypic typing for diseases cuch as agammaglobulinemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, Wiskott-Aldrich syndrome, Fabry's disease, hereditary spherocytosis, von Willebrand's disease, therefultary and sucception of cancer, diseases of the nervous system, infection by pathogenic microorganisms, and characteristics such cautoimmune diseases, inflammation, cancer, diseases of the nervous system, infection by pathogenic microorganisms, and characteristics such cautoimmune diseases, inflammation, cancer, diseases of the nervous system, infection by pathogenic microorganisms, and characteristics candurance, fertility, and susceptibility or receptivity to particular culture context can also be used to produce medicaments for the treatment or receptivity is and susceptibility or ecceptivity to particular context of endrances.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1;

Detection of polymorphic genetic markers of the form

Detection of polymorphic genetic markers of the form

(dc-dA)n(dG-dTyn - using novel nucleic acid mols. as primers

Sample 8; Column 57-58; 186pp; English.

The invention relates to the isolation of polymorphic repeat sequences

thaving the sequence (dc-dA)n.(dG-dTyn which can be used as genetic

markers. Primers based on these sequences can be used to detect these

repeats, especially for use in e.g paternity or maternity testing,

thuman genetic analysis such as linkage analysis of genetic disease,

commercial animal or plant breeding or pedigree analysis.

The repeats, when analysed, fall into 4 categories:

The repeats which are alternating tandem CA repeats with no

interruptions and without adjacent repeats of another sequence;

interruptions and without adjacent repeats of another sequence;

imperfect repeats which are defined as 2 or more runs of uninterrupted

CA repeats separated by no more than 3 consecutive non-repeat bases;

S compound perfect repeats which are uninterrupted runs of CA separated
                                                                                                                                                                                Claim 1, Page 1748; 2245pp; Japanese.

A single-stranded DNA (or its complementary strand or the corresp. double-stranded DNA, which comprises one of the 7837 [63s sequences of given in T19001-T25687] and which is able to hybridise to part of human genomic DNA, CDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed CDNA libraries prepared from various human tissues; synthesis of CDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-end than a sole primer is neglected, almost all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular rissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for sequence 108 BP; 34 A; 26 G; 15 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       21268 TTTTTTTTTTTTTTTTTTTAGGCAGAGTCCTACTCTGTCACCCAGGCTGGAGTGCAGGG 21327

by no more than 3 consecutive non-repeat bases from a run of at least 5 uninterrupted dinucleotide or longer repeats of a sequence other than (dC-dA)n.(dG-dT)n, or from at least 10 uninterrupted monoucleotides; and 4) imperfect compound repeats which are defined as for the perfect compound repeats which are defined as for the perfect scompound repeats except that the runs of CA are interrupted. This sequence is an example of a compound imperfect repeat sequence of structure: T(CT)12GTT(TC)11T(CA)14A(AC)6. Sequence 92 BP: 21 A; 43 C; 1 G; 27 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           QY 19140 ATCACTTGAACCCAGGAGGCAGAGATTGCAGTGAGCTGAGATCGCGCCACTGCATTCCAG 19199

The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-untranslated sequence is unique to a particular mRNA species, almost all the 3'-oriented cDNAs hybridise with specific mRNAs. Bach library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived.
                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

A single-stranded DNA (or its complementary strand or the corresp.

A single-stranded DNA (or its complementary strand or the corresp.

double-stranded DNA) which comprises one of the 7837 "63" sequences

given in T19001-T26837 and which is able to hybridise to part of

human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)

sequences were obtained from 3'-directed cDNA libraries prepared

from various human tissues; synthesis of cDNA was initiated from the

curranslated sequence is unique to a particular mRNA species, almost

all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library

is constructed so as to reflect accurately the relative abundance of

different mRNAs in the particular tissue from which it was derived.

The appearance frequency of a given GS in a cDNA library can be

determined (esp. using primers and probes derived from the GS

sequences) as a means of diagnosing abnormal cell function or for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  24842 TTTATTTTTTTGAGACAGAGTCTCACTCTGTCACCCAGGGTAGAATGCGGTGGTGTGATC 24901

A single-stranded DNA (or its complementary strand or the corresp. A single-stranded DNA (or its complementary strand or the 7837 "GS" sequences given in T19001-T25837 and which comprises one of the 7837 "GS" sequences given in T19001-T25837 and which is able to hybridise to part of human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA ilbraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-untranslated sequence is unique to a particular mRNA species, almost all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0; Gaps

The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from warious human tissues; synthesis of cDNA hibraries prepared from the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-untranslated sequence is unique to a particular mRNA species, almost all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          0; Gaps

                                                                                                                                                                                                                                                                                                                     A single-stranded DNA (or its complementary strand or the corresp.
A single-stranded DNA) which is able to hybridise to part of
double-stranded DNA) which is able to hybridise to part of
stranded DNA) which is able to hybridise to part of
double-stranded DNA, cDNA or mRNA is claimed. The GS (Gene Signature)
c given in T19001-T28837 and which is able to hybridise to part of
thuman genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)
c sequences were obtained from 3'-directed cDNA libraries prepared
from various human tissues; synthesis of cDNA was initiated from the
c 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-
untranslated sequence is unique to a particular mRNA species, almost
c all the 3'-oriented cDNA hybridise with specific mRNAs. Each library
c is constructed so as to reflect accurately the relative abundance of
different mRNAs in the particular tissue from which it was derived.
CT he appearance frequency of a given GS in a cDNA library can be
cc determined (esp. using primers and probes derived from the GS
c sequences) as a means of diagnosing abnormal cell function or for
ce recognishing different cell types.

A single-stranded DNA, which composementary strand or the corresp.

C double-stranded DNA, which composes one of the 7837 "GS" sequences
given in T19001-T26837 and which is able to hybridise to part of
human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)
sequences were obtained from 3'-directed cDNA libraries prepared
from various human tissues; synthesis of cDNA was initiated from the
3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-
untranslated sequence is unique to a particular mRNA species, almost
all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library
c is constructed so as to reflect accurately the relative abundance of
different mRNAs in the particular tissue from which it was derived.
The appearance frequency of a given GS in a cDNA library can be
determined (esp. using primers and probes derived from the GS
c sequences) as a means of diagnosing abnormal cell function or for
recognising different cell types.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               A single-stranded DNA (or its complementary strand or the corresp. double-stranded DNA) which comprises one of the 7837 (GS" sequences or given in T19001-T26837 and which is able to hybridise to part of human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(7) as the sole primer. Since the 3'-end of mRNA by using poly(7) as the sole primer. Since the 3'-end of mRNA by using poly(7) as the sole primer. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS: sequences) as a means of diagnosing abnormal cell function or for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              27386 TTTTTTGTTTTAGAGACAGCATCTTATTCTGTCACCCAGGCTGTAGCTCAGTGGCCCCAA 27445
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           e.g.

Human gene signature HUMGS04188.

Gene signature: messenger RNA; mRNA; relative abundance; frequency;
human; cloning; mapping; non-biased library; diagnosis; detection;
cell typing; abnormal cell function; ss.
Identifying gene signatures in 3'-directed human cDNA library for diagnosis of abnormal cell function, by preparing cDNA that reflects relative abundance of corresp. mRNA in specific human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Identifying gene signatures in 3'-directed human cDNA library for diagnosis of abnormal cell function, by preparing cDNA that reflects relative abundance of corresp. mRNA in specific human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0.2%; Score 61; DB 1; Length 103; 75.2%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   21283 TTTTTACGCAGAGTCCTACTCTGTCACCCAGGCTGGAGTGCAGCGGGTGTGAACATGGCTC 21342
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      A single-stranded DNA (or its complementary strand or the corresp. double-stranded DNA) which comprises one of the 7837 "GS" sequences given in T19001-T26837 and which is able to hybridise to part of human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA libraries prepared from various human tissues; synthesis of cDNA as initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-untranslated sequence is unique to a particular mRNA species, almost all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular is constructed and the particular tissue from which it was derived.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

A single-stranded DNA (or its complementary strand or the corresp. double-stranded DNA) which comprises one of the 7837 "GS" sequences double-stranded DNA) which comprises one of the 7837 "GS" sequences of given in T19001-T26837 and which is able to hybridise to part of human genomic DNA, CDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA hibraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-entranslated sequence is unique to a particular mRNAs ince the 3'-entranslated sequence is unique to a particular mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for sequence 108 BP; 18 A; 23 G; 28 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        2708 GATCTCTCGACCTTGTGATCCACCGGCTCAGCCTCCCAAAGTGCCAGGATTACAGGCAT 2767

PT (dC-dA)n(dG-dT)n - using novel nucleic acid mols. as primers

Disclosure; Column 11-12; 186pp; English.

CC The invention relates to the isolation of polymorphic repeat sequences

CC markers. Primers based on these sequences can be used as genetic

CC markers. Primers based on these sequences can be used to detect these

CC repeats, especially for use in e.g paternity or maternity testing,

CC human genetic analysis such as linkage analysis of genetic disease,

CC commercial animal or plant breeding or pedigree analysis. Clones

CC containing the repeat sequences were isolated by hybridisation of

CC chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT)

CC chromosome-specific phage libraries with a synthetic poly(dC-dA). (dC-dT)

CC chromosome-specific phage libraries with a synthetic poly (dC-dA). (dC-dT)

CC chromosome-specific phage libraries with a synthetic poly (dC-dA). (dC-dT)

CC sequence hap primers T65798-T66047. Those clones where the repeat

CC sequence having the formula: (TC)12(AC)18.

CC sequence having the formula: (TC)12(AC)18.

SQ Sequence (60 BP; 18 A; 30 C; 0 G; 12 T;

strand cDNA was primed with oligo(dT)17 on 50 ng of
strand cDNA was primed with oligo(dT)17 on 50 ng of
DNAse-treated, total cellular RNA obtained from
5,000-10,000 microdissected, histologically normal
prostate epithelial cells. Double-stranded cDNA was
ligated to EcoRI adaptors, 5 cycles of PCR applied to the
cDNA with an adaptor-specific primer, and the resulting
PCR product subcloned into pAMPIO by the UDG-cloning
method (Life Technologies). Average insert size is 600
bp. NOTE: Not directionally cloned. This library was
constructed by David Krizman.

/note="Vector: pAMP10; Site_1: Not1; Site_2: EcoRI; 1st
strand cDNA was primed with oligo(dT)17 on 50 ng of
bNAse-treated, total cellular RNA obtained from
5,000-10,000 microdissected, histologically normal
prostate epithelial cells. Double-stranded cDNA was
ligated to EcoRI adaptor: 5 cycles of PCR applied to the
cDNA with an adaptor-specific primer, and the resulting
PCR product subcloned into pAMP10 by the UGS-cloning
method (Life Technologies). Average insert size is 600
bp. NOTE: Not directionally cloned. This library was
constructed by David Krizman."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        See X05248 for corresponding normal gene sequence. In the defective LDL receptor gene the deletion ocurred between two alu-repetitive sequences, that are in the same direction, the deletion eliminates exoms 13 and 14 and changes the reading frame of the resulting spliced mRNA.
